Amazon Textract – Introduction to Document AI

- Presented by : Praveen
- Faculty Advisor : Dr. Victor Govindaswamy

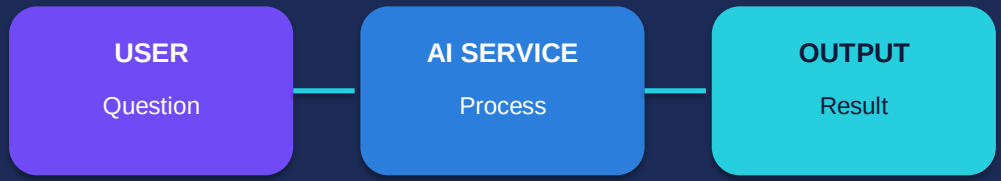

Amazon Textract – Introduction to Document AI

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Extract text from documents**
- Forms and tables
- Structured output
- Document processing workflows
- Human validation when needed

VISUAL CONCEPT | Document upload → Textract → structured data.

INPUT → PROCESSING → USEFUL RESULT

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

This presentation introduces Amazon Textract and its role in extracting text and structured information from supported documents. It covers common workflows, practical considerations, and validation of extracted results.

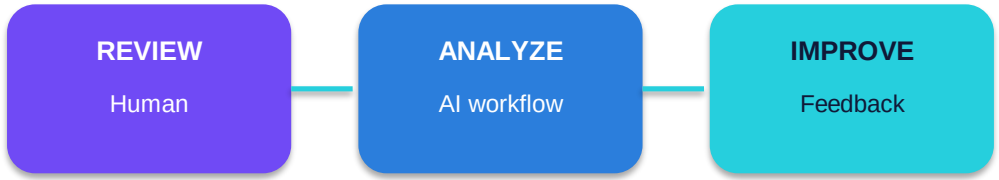

How Amazon Textract Works

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Provide a supported document**
- Choose an analysis operation
- Process text and layout
- Extract forms or tables
- Review structured response

VISUAL CONCEPT | Document processing pipeline.

SERVICE → WORKFLOW → APPLICATION

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

Textract processes supported document inputs and returns structured information according to the operation used. The document format, quality, layout, and selected API affect the result.

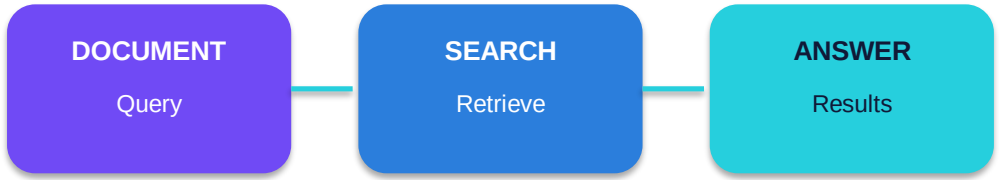

Text Detection and Extraction

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Printed text**
- Line and word information
- Page structure
- Confidence values
- Output validation

VISUAL CONCEPT | Scanned page with extracted text regions.

SERVICE → WORKFLOW → APPLICATION

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

Text extraction can identify words and lines from supported documents. Results should be reviewed for low-quality scans, unusual layouts, and other cases where recognition may be incomplete.

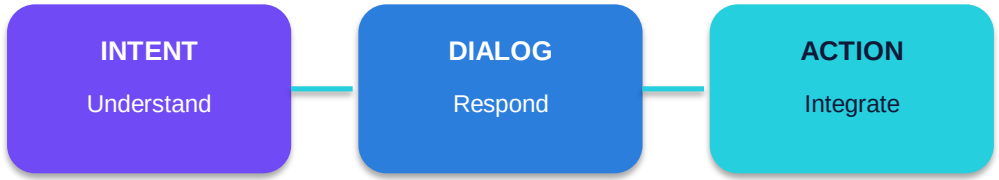

Forms and Key-Value Pairs

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Form fields**
- Key-value relationships
- Field values
- Confidence review
- Downstream data mapping

VISUAL CONCEPT | Form field labels mapped to extracted values.

SERVICE → WORKFLOW → APPLICATION

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

Form analysis can help identify relationships between field labels and their values. Applications should validate extracted fields before using them for decisions or updating important records.

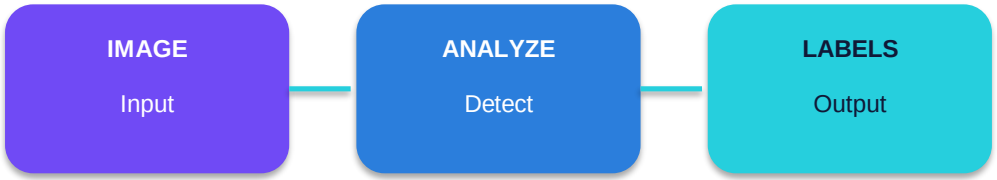

Table Extraction

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Rows and columns**
- Cell relationships
- Tabular structure
- Data normalization
- Quality checks

VISUAL CONCEPT | Document table converted into structured rows and columns.

INPUT → SERVICE → OUTPUT

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

Table extraction helps represent document tables as structured data. Applications may need to normalize cell values and check whether row and column relationships were captured correctly.

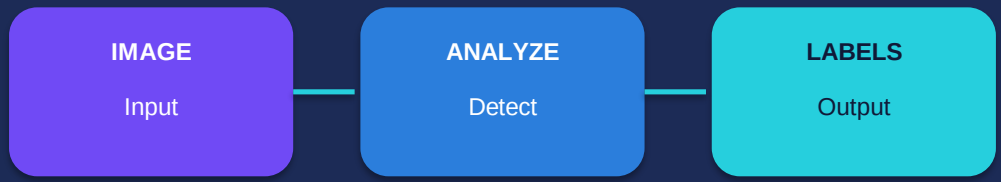

Textract – Hands-On Workflow

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Select sample document**
- Run the course exercise
- Inspect extracted output
- Check forms and tables
- Record observations

VISUAL CONCEPT | Hands-on checklist with document and output preview.

INPUT → SERVICE → OUTPUT

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

A hands-on exercise gives learners experience submitting a sample document and reviewing the returned data. Use only approved sample documents and follow the course's current console or API steps.

Handling Complex Documents

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Low-resolution scans**
- Rotated pages
- Dense layouts
- Handwriting and varied formats
- Review uncertain fields

VISUAL CONCEPT | Document quality issues and validation workflow.

INPUT → SERVICE → OUTPUT

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

Document quality and layout can affect extraction. Preprocessing, selecting the correct operation, and reviewing uncertain fields can help manage difficult cases, though results still require validation.

Integrating Textract into Applications

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Upload or ingest documents**
- Call the appropriate API
- Process the response
- Store structured results
- Handle failures safely

VISUAL CONCEPT | Application-to-Textract document workflow.

INPUT → SERVICE → OUTPUT

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

A document-processing application typically ingests a document, invokes an appropriate Textract operation, processes the response, and stores results in a controlled system. Permissions and error handling should be designed from the beginning.

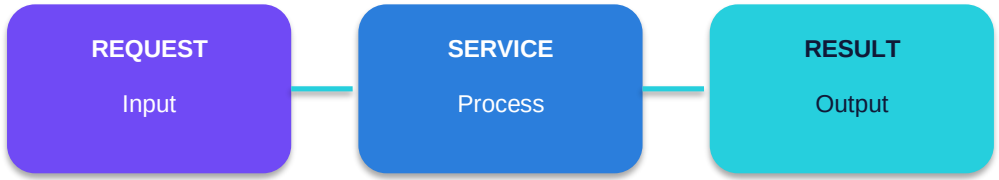

Security, Privacy and Data Governance

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Least-privilege permissions**
- Approved document sources
- Sensitive information
- Retention requirements
- Access and audit controls

VISUAL CONCEPT | Secure document-processing architecture.

INPUT → SERVICE → OUTPUT

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

Document workflows may process sensitive information. Apply least-privilege access, approved data-handling practices, suitable retention controls, and organizational compliance requirements.

Validating Extracted Information

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Confidence is not certainty**
- Check critical fields
- Compare against source
- Use review thresholds
- Keep audit records when required

VISUAL CONCEPT | Extraction output → validation rules → approved data.

INPUT → SERVICE → OUTPUT

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

Extracted values should be validated before use in financial, legal, medical, or other consequential workflows. Confidence values can guide review but should not replace appropriate verification.

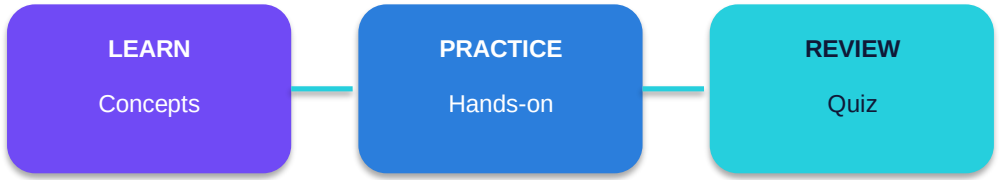

Comparing the Services in This Course Section

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **A2I: human review workflows**
- Kendra: intelligent search
- Lex: conversational interfaces
- Rekognition: media analysis
- Textract: document extraction

VISUAL CONCEPT | Five-service comparison by task and input type.

INPUT → SERVICE → OUTPUT

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

The course section presents multiple AWS AI services with different purposes. Understanding their roles helps select a suitable service or combine components into a workflow, while checking current availability and service documentation.

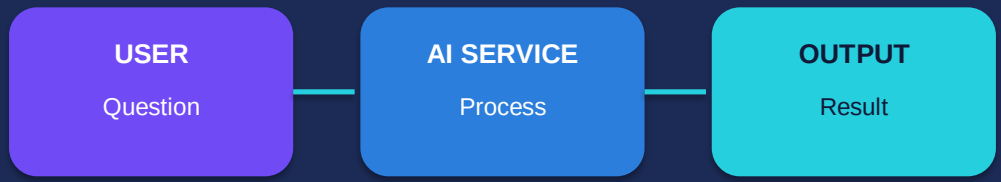

Conclusion – Document Processing and Machine Learning Services

Text extraction, forms, tables, application integration, and document governance

MAIN POINTS

- **Understand Textract workflow**
- Extract text, forms and tables
- Validate outputs
- Protect document data
- Choose services by use case

VISUAL CONCEPT | End-to-end document AI workflow.

INPUT → PROCESSING → USEFUL RESULT

Conceptual workflow illustration • not an AWS console screenshot

DESCRIPTION

This presentation summarized Amazon Textract and connected it to the wider course section on AWS machine learning services. Reliable implementations combine appropriate service selection, validation, security, and monitoring.
